

CS571: Programming Languages

CS571 Programming Languages

1

Exam 1

- **Date:** March 2nd (Friday)
- **Time:** 3:30pm – 5pm
- **Place:** LH008
- **Materials:** 01-05 (compiler, basic semantics, perl)
- Close book, close notes
- Triple-seating (two empty seats between two students)

2

What is Perl?

- Perl is a **high-level, general-purpose, interpreted** programming language
 - * Runs on Windows, Unix, Linux and MacOS
- Originally developed by Larry Wall in 1987 as a general-purpose Unix scripting language.
- Perl borrows features from other programming languages including C, Shell scripting, AWK, and sed.

3

Applications of Perl

- Widely used for **Common Gateway Interface (CGI)** programming
 - * **CGI:** used by web servers to run external programs (CGI scripts), most often to generate web content dynamically.
 - * High-traffic websites that use Perl extensively include amazon, bbc.co.uk, priceline.com, imdb, craigslist etc.
- Text processing, e.g. reformatting text files, implementing simple search-and-replace operations etc.

4

The Basic Hello World Program (hello.pl)

- Comments begin with a # character
- All statements end with ;
- A simple example:

```
#!/usr/bin/perl
print "Hello World!\n";
```
- **Execution:** `perl hello.pl`

5

Types of Data: Scalar Variables

- **Scalar variables:** store a single value
 - * \$ followed by a letter or _, e.g. \$a, \$b, \$c, \$_
 - * Up to 251 letters, digits, and _
- Scalar variables are **case-sensitive**
 - e.g. \$user is different from \$User
- Variable type (int, char, ...) is decided at run time
 - * \$a = 5; # now an integer
 - * \$a = "perl"; # now a string

6

Type of Data: Numbers

- **Numbers**
 - * Integer, e.g. 25, -4, 25_000_000
 - * Floating point, e.g. 0.5
 - * Binary numbers, e.g. 0b1101
 - * Hexadecimal numbers, e.g. 0xFF

CS571 Programming Languages

7

Operators

- **Arithmetic operators:** +, -, *, /, ** (raise to the power), ++, --,
- **Relational operators:** ==, !=, >, <, >=, <=
- **Boolean operators:** &&(and), || (or), ! (not)
- E.g.

```
Si = 1;
Si = (Si + 3) * 2; # Parentheses for order of operation
Si++;             # Si = Si + 1;
Si *= 3;          # Si = Si * 3;
print "Si\n";
```

8

Operators

- **Arithmetic operators:** +, -, *, /, ** (raise to the power), ++, --,
- **Relational operators:** ==, !=, >, <, >=, <=
- **Boolean operators:** &&(and), || (or), ! (not)
- E.g.

```
Si = 1;
Si = (Si + 3) * 2; # Parentheses for order of operation
Si++;             # Si = Si + 1;
Si *= 3;          # Si = Si * 3;
print "Si\n";
```

Output: 27

9

Type of Data: String

- **Double-quoted string vs single-quoted string**
 - * Perl looks for variables inside double-quoted strings and replaces them with their value

```
Svar = "Halloween";
print "Happy Svar.\n";
```
 - * This does not happen when you use single quotes

```
print 'Happy Svar.\n';
```

CS571 Programming Languages

10

Type of Data: String

- **Double-quoted string vs single-quoted string**
 - * Perl looks for variables inside double-quoted strings and replaces them with their value

```
Svar = "Halloween";
print "Happy Svar.\n";
```

Output: Happy Halloween.
 - * This does not happen when you use single quotes

```
print 'Happy Svar.\n';
```

CS571 Programming Languages

11

Type of Data: String

- **Double-quoted string vs single-quoted string**
 - * Perl looks for variables inside double-quoted strings and replaces them with their value

```
Svar = "Halloween";
print "Happy Svar.\n";
```

Output: Happy Halloween.
 - * This does not happen when you use single quotes

```
print 'Happy Svar.\n';
```

Output: Happy Svar.\n

CS571 Programming Languages

12

Operators (concat.pl)

- String operators
 - * Concatenation: "."

```
$first_name = "Tom";
$last_name = "Smolka";
$full_name = $first_name . " " . $last_name;
print $full_name
```
 - * Repetition: "marked by x"

```
print "Ba" . "na"x4, "\n"
```

13

Operators (concat.pl)

- String operators
 - * Concatenation: "."

```
$first_name = "Tom";
$last_name = "Smolka";
$full_name = $first_name . " " . $last_name;
print $full_name
```

output: Tom Smolka
 - * Repetition: "marked by x"

```
print "Ba" . "na"x4, "\n"
```

14

Operators (concat.pl)

- String operators
 - * Concatenation: "."

```
$first_name = "Tom";
$last_name = "Smolka";
$full_name = $first_name . " " . $last_name;
print $full_name
```

output: Tom Smolka
 - * Repetition: "marked by x"

```
print "Ba" . "na"x4, "\n"
```

Output: Banananana

15

Relational Operators for Strings (gt.pl)

- Equal: **eq**
 - Greater than: **gt**
 - Greater than or equal to: **ge**
 - Less than: **lt**
 - Less than or equal to: **le**
- ```
$language = "Perl";
if ($language == "Perl") ... Wrong!
if ($language eq "Perl") ... Correct

$name1 = "abc"; $name2 = "bca";
if ($name1 gt $name2) {print "greater";}
if ($name1 lt $name2) {print "smaller";}
```

16

## Relational Operators for Strings (gt.pl)

- Equal: **eq**
  - Greater than: **gt**
  - Greater than or equal to: **ge**
  - Less than: **lt**
  - Less than or equal to: **le**
- ```
$language = "Perl";
if ($language == "Perl") ... Wrong!
if ($language eq "Perl") ... Correct

$name1 = "abc"; $name2 = "bca";
if ($name1 gt $name2) {print "greater";}
if ($name1 lt $name2) {print "smaller";}
```
- Output: smaller**

17

String Functions

- Convert to **upper** case: **uc**
 - Convert only the **first char to upper case**: **ucfirst**
 - Convert to **lower** case: **lc**
 - Convert only the **first char to lower case**: **lcfirst**
- ```
$name = "abc"; $name = uc($name); print $name, "\n";
$name = uc($name); print $name, "\n";
$name = lc($name); print $name, "\n";
$name = lc($name); print $name, "\n";
```

18

## String Functions

- Convert to **upper** case: uc
- Convert only the **first char to upper case**: ucfirst
- Convert to **lower** case: lc
- Convert only the **first char to lower case**: lcfirst

```
$name = "abc"; $name = ucfirst($name); print $name, "\n";
$name = uc($name); print $name, "\n";
$name = lcfirst($name); print $name, "\n";
$name = lc($name); print $name, "\n";
```

**Output:**

```
Abc
ABC
aBC
abc
```

19

## Type of Data: Array

- Array variable is denoted by the @ symbol

```
* @array = ("good", "afternoon");
* @array = ();
* @array = (10..20);
```

20

## Type of Data: Array (array.pl)

- Indexed by number
  - \* Index starts at 0
  - \* To access one element of the array : `$array[$index]`
  - \* Why? Because every element in the array is scalar

```
@array = (1..5);
print "$array[0]\n";
```

```
print "$array[8]\n"
```

```
print "$array[-1]\n"
```

21

## Type of Data: Array (array.pl)

- Indexed by number
  - \* Index starts at 0
  - \* To access one element of the array : `$array[$index]`
  - \* Why? Because every element in the array is scalar

```
@array = (1..5);
print "$array[0]\n";
```

**Output: 1**

```
print "$array[8]\n"
```

```
print "$array[-1]\n"
```

22

## Type of Data: Array (array.pl)

- Indexed by number
  - \* Index starts at 0
  - \* To access one element of the array : `$array[$index]`
  - \* Why? Because every element in the array is scalar

```
@array = (1..5);
print "$array[0]\n";
```

**Output: 1**

```
print "$array[8]\n"
```

**Output:**

```
print "$array[-1]\n"
```

23

## Type of Data: Array (array.pl)

- Indexed by number
  - \* Index starts at 0
  - \* To access one element of the array : `$array[$index]`
  - \* Why? Because every element in the array is scalar

```
@array = (1..5);
print "$array[0]\n";
```

**Output: 1**

```
print "$array[8]\n"
```

**Output:**

```
print "$array[-1]\n" # print 5
```

**Output: 5**

24

### Type of Data: Array (array1.pl)

- Access all elements in the array  

```
@array = (1 ..20);
print @array;
```
- Accessing multiple elements in the array  

```
print @array[3, 4, 5..7];
```
- To find the index of the last element in an array  

```
print $#array;
```

```
@ numbers = ();
print $#numbers;
```

25

### Type of Data: Array (array1.pl)

- Access all elements in the array  

```
@array = (1 ..20);
print @array;
```

**Output: 1234567891011121314151617181920**
- Accessing multiple elements in the array  

```
print @array[3, 4, 5..7];
```
- To find the index of the last element in an array  

```
print $#array;
```

```
@ numbers = ();
print $#numbers;
```

26

### Type of Data: Array (array1.pl)

- Access all elements in the array  

```
@array = (1 ..20);
print @array;
```

**Output: 1234567891011121314151617181920**
- Accessing multiple elements in the array  

```
print @array[3, 4, 5..7];
```

**Output :45678**
- To find the index of the last element in an array  

```
print $#array;
```

```
@ numbers = ();
print $#numbers;
```

27

### Type of Data: Array (array1.pl)

- Access all elements in the array  

```
@array = (1 ..20);
print @array;
```

**Output: 1234567891011121314151617181920**
- Accessing multiple elements in the array  

```
print @array[3, 4, 5..7];
```

**Output :45678**
- To find the index of the last element in an array  

```
print $#array;
```

**Output: 19**
  

```
@ numbers = ();
print $#numbers;
```

28

### Type of Data: Array (array1.pl)

- Access all elements in the array  

```
@array = (1 ..20);
print @array;
```

**Output: 1234567891011121314151617181920**
- Accessing multiple elements in the array  

```
print @array[3, 4, 5..7];
```

**Output :45678**
- To find the index of the last element in an array  

```
print $#array;
```

**Output: 19**
  

```
@ numbers = ();
print $#numbers;
```

**Output: -1**

29

### Arrays: Quoted Word

- Quoted word lists using qw operator  

```
@fruits = ("apples", "bananas", "cherries");
```

```
@fruits = qw(apples bananas cherries); # Same as above
```

30

### Array Operations (test1.pl)

- Can dynamically lengthen or shorten arrays
- To append to the **end** of an array : push  

```
@array = qw(red blue green);
push (@array, "black");
print $array[3];
```
- To remove the **last** element of the array: pop  

```
$element = pop @array;
print $element;
```

31

### Array Operations (test1.pl)

- Can dynamically lengthen or shorten arrays
- To append to the **end** of an array : push  

```
@array = qw(red blue green);
push (@array, "black");
print $array[3];
```

  
**Output: black**
- To remove the **last** element of the array: pop  

```
$element = pop @array;
print $element;
```

32

### Array Operations (test1.pl)

- Can dynamically lengthen or shorten arrays
- To append to the **end** of an array : push  

```
@array = qw(red blue green);
push (@array, "black");
print $array[3];
```

  
**Output: black**
- To remove the **last** element of the array: pop  

```
$element = pop @array;
print $element;
```

  
**Output: black**  
  
 @array now contains ("red", "blue", "green")

33

### Arrays Operations (test1.pl)

- unshift: to prepend to the **beginning** of an array  

```
@array = qw(red blue green);
unshift (@array, "black");
```
- To remove the **first** element of the array  

```
$element = shift @array;
print $element; # prints "black"
```

34

### Arrays Operations (test1.pl)

- unshift: to prepend to the **beginning** of an array  

```
@array = qw(red blue green);
unshift (@array, "black");
```

  
 The array now contains "black", "red", "blue", "green"
- To remove the **first** element of the array  

```
$element = shift @array;
print $element; # prints "black"
```

35

### Arrays Operations (test1.pl)

- unshift: to prepend to the **beginning** of an array  

```
@array = qw(red blue green);
unshift (@array, "black");
```

  
 The array now contains "black", "red", "blue", "green"
- To remove the **first** element of the array  

```
$element = shift @array;
print $element; # prints "black"
```

  
 The array now contains "red", "blue", "green"

36

### Arrays Operations (splice.pl)

- splice: cut out and return a chunk or portion of an array

```
splice(@ARRAY, INDEX, LENGTH, @REPLACE_WITH);
```

```
@fruits = qw(Banana Orange Apple Mango);
@removed = splice(@fruits, 1, 2);
print @fruits, "\n";
print @removed, "\n";
```

37

### Arrays Operations (splice.pl)

- splice: cut out and return a chunk or portion of an array

```
splice(@ARRAY, INDEX, LENGTH, @REPLACE_WITH);
```

```
@fruits = qw(Banana Orange Apple Mango);
@removed = splice(@fruits, 1, 2);
print @fruits, "\n";
print @removed, "\n";
```

```
BananaMango
OrangeApple
```

38

### Arrays: foreach

- Foreach allows you to iterate over an array
- Example:

```
@array = (1..5);
foreach $element (@array)
{ print "$element\n"; }
```

39

### Arrays: foreach

- Foreach allows you to iterate over an array
- Example:

```
@array = (1..5);
foreach $element (@array)
{ print "$element\n"; }
```

Output:

```
1
2
3
4
5
```

40

### Adding to An Arrays (Array2.pl)

```
@array1 = (1, 2, 3);
@array2 = (@array1, 4, 5, 6);
print @array2;
```

41

### Adding to An Arrays (Array2.pl)

```
@array1 = (1, 2, 3);
@array2 = (@array1, 4, 5, 6);
print @array2;
```

Output: 123456

42

### Types of Data: Hash (hash.pl)

- Each entry of a hash contains two components: Key and Value .
- The Hash is denoted with % E.g.  

```
%data = ('John' => 45, 'Lisa'=> 30, 'Tom' => 40);
```
- Elements are accessed using {} (like [] in arrays)  

```
print "$data{'John'}\n";
print "$data{'Lisa'}\n";
print "$data{'Tom'}\n";
```

43

### Types of Data: Hash (hash.pl)

- Each entry of a hash contains two components: Key and Value .
- The Hash is denoted with % E.g.  

```
%data = ('John' => 45, 'Lisa'=> 30, 'Tom' => 40);
```
- Elements are accessed using {} (like [] in arrays)  

```
print "$data{'John'}\n";
print "$data{'Lisa'}\n";
print "$data{'Tom'}\n";
```

**output:**  
45  
30  
40

44

### Types of Data: Hash (hash.pl)

- ```
%data = ('John' => 45, 'Lisa'=> 30, 'Tom' => 40);
```
- Adding a new key-value pair

```
$data{'Mary'} = 20
```
 - Each key can have only one value

```
$data{'Mary'} = 25
```

45

Types of Data: Hash (hash.pl)

- ```
%data = ('John' => 45, 'Lisa'=> 30, 'Tom' => 40);
```
- Adding a new key-value pair  

```
$data{'Mary'} = 20
```
  - Each key can have only one value  

```
$data{'Mary'} = 25
```

```
overwrites previous assignment
```
  - Multiple keys can have the same value
  - Deleting a key-value pair  

```
delete $data{'John'}
```

46

### Types of Data: Hash (hash.pl)

- keys** returns a list of the keys
- values** returns a list of the values  

```
%data = ('John' => 45, 'Lisa'=> 30, 'Tom' => 40);
```

Accessing all keys  

```
print keys %data;
```

Accessing all values  

```
print values %data;
```

Accessing all key-value pairs  

```
for (keys %data) {print $_; print "$data{$_} \n";}
```

47

### Types of Data: Hash (hash.pl)

- keys** returns a list of the keys
- values** returns a list of the values  

```
%data = ('John' => 45, 'Lisa'=> 30, 'Tom' => 40);
```

Accessing all keys  

```
print keys %data;
```

**Output: LisaJohnTom**

Accessing all values  

```
print values %data;
```

Accessing all key-value pairs  

```
for (keys %data) {print $_; print "$data{$_} \n";}
```

48

### Types of Data: Hash (hash.pl)

- **keys** returns a list of the keys
  - **values** returns a list of the values
- ```
%data = ('John' => 45, 'Lisa' => 30, 'Tom' => 40);
```
- Accessing all keys
print keys %data;
Output: LisaJohnTom
- Accessing all values
print values %data;
Output: 304540
- Accessing all key-value pairs
for (keys %data) {print \$_; print "\$data{\$_} \n"};

49

Types of Data: Hash (hash.pl)

- **keys** returns a list of the keys
 - **values** returns a list of the values
- ```
%data = ('John' => 45, 'Lisa' => 30, 'Tom' => 40);
```
- Accessing all keys  
**print keys %data;**  
**Output: LisaJohnTom**
- Accessing all values  
**print values %data;**  
**Output: 304540**
- Accessing all key-value pairs  
**for (keys %data) {print \$\_; print "\$data{\$\_} \n"};**  
**Output: Lisa30**  
**John45**  
**Tom40**

50

### Check If a Key is in the Hash (hash.pl)

```
%data = ('John' => 45, 'Lisa' => 30, 'Tom' => 40);

$s = "John";
for (keys %data) {if ($s eq $_) {print "match";}};
```

CS571 Programming Languages

51

### Check If a Key is in the Hash

```
%data = ('John' => 45, 'Lisa' => 30, 'Tom' => 40);

$s = "John";
for (keys %data) {if ($s eq $_) {print "match";}};
```

**Output: match**

CS571 Programming Languages

52

### Scope (test11.pl)

- Lexical variable: **my \$variable**
- ```
$record = 4;
print "record is ", $record, "\n";
{ my $record;
  $record = 7;
  print "inside the block, record is ", $record, "\n";
}
print "exit the block, record is ", $record, "\n";
```

CS571 Programming Languages

53

Scope (test11.pl)

- Lexical variable: **my \$variable**
- ```
$record = 4;
print "record is ", $record, "\n";
{ my $record;
 $record = 7;
 print "inside the block, record is ", $record, "\n";
}
print "exit the block, record is ", $record, "\n";
```
- Output:**  
**record is 4**  
**inside the block, record is 7**  
**exit the block, record is 4**

CS571 Programming Languages

54

## Control Structures

55

### Conditional Statements (if.pl)

- **Conditional statements**

- \* if, elsif, else
- \* Unless, elsif, else

```
Sweather = "Sun";
if ($weather eq "Rain") { print "Umbrella!\n"; }
elsif ($weather eq "Sun") {print "Sunglasses!\n";}
else {print "Anti Radiation Armor!\n";}
```

56

### Conditional Statements (if.pl)

- **Conditional statements**

- \* if, elsif, else
- \* Unless, elsif, else

```
Sweather = "Sun";
if ($weather eq "Rain") { print "Umbrella!\n"; }
elsif ($weather eq "Sun") {print "Sunglasses!\n";}
else {print "Anti Radiation Armor!\n";}
```

**Output: Sunglasses**

57

### Conditional Statements (unless.pl)

- **unless** statements are the opposite of if ... else statements.

- \* Equivalent to **if (not \$boolean)**

```
Sweather = "Rain";
unless ($weather eq "Rain") {
 print "Dress as you wish!\n"; }
else {print "Umbrella!\n";}
```

- And remember the braces are required!

58

### Conditional Statements (unless.pl)

- **unless** statements are the opposite of if ... else statements.

- \* Equivalent to **if (not \$boolean)**

```
Sweather = "Rain";
unless ($weather eq "Rain") {
 print "Dress as you wish!\n"; }
else {print "Umbrella!\n";}
```

**Output: Umbrella**

- And remember the braces are required!

59

### While Loop (while.pl)

- **While:** Loops when the boolean expression is true

- Example :

```
$i = 0;
while ($i <= 1000) {
 print "$i\n";
 $i++;
}
```

60

## While Loop (while.pl)

- **While:** Loops when the boolean expression is true

- Example :

```
Si = 0;
while (Si <= 1000) {
 print "Si\n";
 Si++;
}
```

Output: 0--1000

61

## Until Loop (until.pl)

- **until:** evaluates an expression repeatedly until a specific condition is met.
  - \* Loops until boolean is true
  - \* Opposite of **while**

- Example:

```
Si = 0;
until (Si == 1000) {
 print "Si\n"; Si++;
}
```

62

## Until Loop (until.pl)

- **until:** evaluates an expression repeatedly until a specific condition is met.
  - \* Loops until boolean is true
  - \* Opposite of **while**

- Example:

```
Si = 0;
until (Si == 1000) {
 print "Si\n"; Si++;
}
```

Output: 0 -- 999

63

## For Loops

- **for loop**
  - \* Like C: for (initialization; condition; increment)

Example:

```
for (Si = 0; Si <= 1000; Si=Si+2) {
 print "Si\n";
}
```

64

## For Loops

- **for loop**
  - \* Like C: for (initialization; condition; increment)

Example:

```
for (Si = 0; Si <= 1000; Si=Si+2) {
 print "Si\n";
}
```

Output: 0, 2, 4, ..., 1000

65

## Moving around in a Loop (next.pl)

- **next:** ignore the current iteration
- **last:** terminates the loop.

- Example

```
for (Si = 0; Si < 10; Si++) {
 if (Si == 1 || Si == 3) { next; }
 elsif(Si == 5) { last; }
 else {print "Si\n";}
}
```

66

### Moving around in a Loop (next.pl)

- **next**: ignore the current iteration
- **last**: terminates the loop.

- Example

```
for ($i = 0; $i < 10; $i++) {
 if ($i == 1 || $i == 3) { next; }
 elsif ($i == 5) { last; }
 else { print "$i\n"; }
}
```

**Output:**   0  
              2  
              4

67

### Regular Expression

CS571 Programming Languages

68

### Regular Expressions

- Regular expressions perform textual pattern matching
- Does a string
  - \* contain the letters "dog" in order?
  - \* not contain the letter "z"?
  - \* begin with the letters "Y" or "y"?
  - \* end with a question mark
  - \* contain only letters?
  - \* contain only digits?

CS571 Programming Languages

69

### Match Operator (match.pl)

- **m/PATTERN/** or **/PATTERN/** - the match operator
- ```
if ($word =~ m/ing/) { print "$word\n"; }
```
- **=~** : return true if the string matches the regular expression
 - **!~** : return true if string doesn't match.
 - Match line position
 - * **^** start of a line
 - * **\$** end of a line
- E.g. `$word =~ m/ing$/`

70

Match Operator (match.pl)

```
$word = "going home";
print $word, "\n";
if ($word =~ m/ing/) { print "match\n"; }
if ($word =~ m/^ing/) { print "start with ing\n"; }
if ($word =~ m/ing$/) { print "end with ing\n"; }
```

CS571 Programming Languages

71

Match Operator (match.pl)

```
$word = "going home";
print $word, "\n";
if ($word =~ m/ing/) { print "match\n"; }
if ($word =~ m/^ing/) { print "start with ing\n"; }
if ($word =~ m/ing$/) { print "end with ing\n"; }
```

Output:
going home
match

CS571 Programming Languages

72

Match Operator (match.pl)

```
$word = "home going";
print $word, "\n";
if ($word =~ m/ing/) { print "match\n";}
if ($word =~ m/^ing/) { print "start with ing\n";}
if ($word =~ m/ing$/) { print "end with ing\n";}
```

CS571 Programming Languages

73

Match Operator (match.pl)

```
$word = "home going";
print $word, "\n";
if ($word =~ m/ing/) { print "match\n";}
if ($word =~ m/^ing/) { print "start with ing\n";}
if ($word =~ m/ing$/) { print "end with ing\n";}
```

Output:

```
home going
match
end with ing
```

CS571 Programming Languages

74

Match Operator (match.pl)

```
$word = "ing";
print $word, "\n";
if ($word =~ m/ing/) { print "match\n";}
if ($word =~ m/^ing/) { print "start with ing\n";}
if ($word =~ m/ing$/) { print "end with ing\n";}
```

CS571 Programming Languages

75

Match Operator (match.pl)

```
$word = "ing";
print $word, "\n";
if ($word =~ m/ing/) { print "match\n";}
if ($word =~ m/^ing/) { print "start with ing\n";}
if ($word =~ m/ing$/) { print "end with ing\n";}
```

Output:

```
ing
match
start with ing
end with ing
```

CS571 Programming Languages

76

Ranges of Regular Expressions

- Ranges can be specified in Regular Expressions
- Match any characters in a list : [...]
 - * [A-Z] Upper case letters
 - * [a-z] Lower case letter
 - * [A-Za-z] Upper or lower case letter
- Ranges of Digits can also be specified, e.g. [0-9]

77

Ranges of Regular Expressions

- Negating Ranges
 - * [^0-9] /

78

Ranges of Regular Expressions

- Negating Ranges
 - * `/[^0-9]/`:
Match anything except a digit
 - * `/[^a]/`:

79

Ranges of Regular Expressions

- Negating Ranges
 - * `/[^0-9]/`:
Match anything except a digit
 - * `/[^a]/`:
Match anything except an a
 - * `/[^A-Z]/`:

80

Ranges of Regular Expressions

- Negating Ranges
 - * `/[^0-9]/`:
Match anything except a digit
 - * `/[^a]/`:
Match anything except an a
 - * `/[^A-Z]/`:
Match anything that starts with something other than a single upper case letter
 - ♦ First `^`: start of line
 - ♦ Second `^`: negation

81

\\$

- What if we want to look for all strings that equal to '\$'
 - * Use the `\` symbol
 - * `/\$/` Regular expression to search for \$
- What does the following Regular Expressions Match?
 - `/[ABCDEFGHIJKLMNOP$]\$/`
 - `/[A-P$]\$/`

82

\\$

- What if we want to look for all strings that equal to '\$'
 - * Use the `\` symbol
 - * `/\$/` Regular expression to search for \$
- What does the following Regular Expressions Match?
 - `/[ABCDEFGHIJKLMNOP$]\$/`
 - `/[A-P$]\$/`

Matches any line containing (A-P or \$) followed by \$

83

Patterns provided in Perl

- Some Patterns
 - * `\d` `[0-9]`
 - * `\w` `[a-zA-Z0-9_]` # word
 - * `\s` `[\r\t\n]` # white space pattern
 - * `\D` `[^0-9]` #Non-digit
 - * `\W` `[^a-zA-Z0-9_]` # non word
 - * `\S` `[\r\t\n]` #non-whitespace
- Example : `(19\d\d)`

84

Patterns provided in Perl

- Some Patterns
 - * `\d` `[0-9]`
 - * `\w` `[a-zA-Z0-9_]` # word
 - * `\s` `[\r\t\n]` # white space pattern
 - * `\D` `[^0-9]` #Non-digit
 - * `\W` `[^a-zA-Z0-9_]` # non word
 - * `\S` `[^\r\t\n]` #non-whitespace
- Example : `(19\d\d)`
 - * Looks for any year in the 1900's

85

Word Boundary Metacharacter

- * `\b`: the boundary between a `\w` character and a `\W` character
- Examples:
 - * `/Jeff\b/` Match Jeff but not Jefferson
 - * `/\bform/` Match form or formation but not Information
 - * `/\bform\b/` Match form but neither information nor formation

86

Word Boundary Metacharacter (bound.pl)

```
$word = "going home"; print $word, "\n";
if ($word =~ m/ing\b/) { print "match 1\n";}
if ($word =~ m/\bing/) { print "match 2\n";}
$word = "ing home"; print $word, "\n";
if ($word =~ m/ing\b/) { print "match 3\n";}
if ($word =~ m/\bing/) { print "match 4\n";}
```

CS571 Programming Languages

87

Word Boundary Metacharacter (Cont.)

```
$word = "going home"; print $word, "\n";
if ($word =~ m/ing\b/) { print "match 1\n";}
if ($word =~ m/\bing/) { print "match 2\n";}
$word = "ing home"; print $word, "\n";
if ($word =~ m/ing\b/) { print "match 3\n";}
if ($word =~ m/\bing/) { print "match 4\n";}
```

Output:

```
going home
match 1
ing home
match 3
match 4
```

CS571 Programming Languages

88

DOT, PIPE

- * `.`: any character except a new line
 - * `/b.bble/`: bobble, babble, bubble...
 - * `/oat/`: boat, coat, goat, ...
- * `|`: alternation
 - * `/Bird(A|B)/`: Match BirdA or BirdB
 - * `/B|b/`: Match B or b
 - * `/^(B|b)ird/`:

89

DOT, PIPE

- * `.`: any character except a new line
 - * `/b.bble/`: bobble, babble, bubble...
 - * `/oat/`: boat, coat, goat, ...
- * `|`: alternation
 - * `/Bird(A|B)/`: Match BirdA or BirdB
 - * `/B|b/`: Match B or b
 - * `/^(B|b)ird/`: Match Bird or bird at the beginning of a line

90

- `?`: the character occurs zero or one time
`/worl?ds/`: match either worlds or words
- `*`: the character occurs zero or more times
`/ab*c/`: match 'ac', 'abc', 'abbc', 'abbbc' ect...
- `+`: the character occurs one or more times
`/ab+c/`: match 'abc', 'abbc', 'abbbc' ect...

91

Modifying Text With Regular Expressions

92

Modifying Text (sub.pl)

- **Substitution: `~s`**
 - If there is a match, then replace it with the given string
- **Example :**

```
# replace the first occurrence of abc with cba
$var1 = "abcde abcde";
$var1 =~ s/abc/cba/; print $var1;

# replace all occurrence of abc with cba
$var2 = "abcde abcde";
$var2 =~ s/abc/cba/g; print $var2;
```

93

Modifying Text (sub.pl)

- **Substitution: `~s`**
 - If there is a match, then replace it with the given string
- **Example :**

```
# replace the first occurrence of abc with cba
$var1 = "abcde abcde";
$var1 =~ s/abc/cba/; print $var1;
Output: cbaed abcde

# replace all occurrence of abc with cba
$var2 = "abcde abcde";
$var2 =~ s/abc/cba/g; print $var2;
```

94

Modifying Text (sub.pl)

- **Substitution: `~s`**
 - If there is a match, then replace it with the given string
- **Example :**

```
# replace the first occurrence of abc with cba
$var1 = "abcde abcde";
$var1 =~ s/abc/cba/; print $var1;
Output: cbaed abcde

# replace all occurrence of abc with cba
$var2 = "abcde abcde";
$var2 =~ s/abc/cba/g; print $var2;
Output: cbaed cbade
```

95

`$&`, `$'` etc (match3.pl)

- `$&`: contains the string matched
 - `$'`: the text until the first match
 - `$'`: the text after the last match
 - `$1, $2`: the text matched in the first, second parenthesis
- ```
$target="I have 25 apples";
if($target =~ /(d+)/) {print "match\n";}
print("$&\n"); print("$'\n"); print("$'\n");
print("$1\n");
```

96

### \$&, \$' etc (match3.pl)

- `$&`: contains the string matched
- `$'`: the text until the first match
- `$'`: the text after the last match
- `$1, $2`: the text matched in the first, second parenthesis

```

$target="I have 25 apples";
if($target =~ /(d+)/) {print "match\n";}
print("$&\n"); print("$'\n"); print("$'\n");
print("$1\n");

```

**Output:**

```

match
25
apples
I have
25

```

97

### \$&, \$' etc (match4.pl)

```

$exp = "I crave to rule the world!";
if($exp =~ /^([A-Za-z+]*) \b ([A-Za-z]+) /)
{
 print "$1\n";
 print "$2\n";
}

```

98

### \$&, \$' etc (match4.pl)

```

$exp = "I crave to rule the world!";
if($exp =~ /^([A-Za-z+]*) \b ([A-Za-z]+) /)
{
 print "$1\n";
 print "$2\n";
}

```

**Output:**

```

I
to rule the world

```

99

## Subroutines

CS571: Programming Languages

100

### Subroutines (test9.pl)

- Subroutines are declared with the **sub** keyword
  - Arguments are passed into the `@_` array
- ```

sub add_one {
    my ($n) = @_[0];      # Copy first argument
    return ($n + 1); }
my ($a, $b) = (10, 0);
add_one($a);              # Return value is lost
$b = add_one($a);         # $a is 10, $b is 11

```

CS571: Programming Languages

101

Subroutines (test9.pl)

```

sub add_one { my ($n) = @_[0]; return ($n + 1); }
sub add_two { my ($n) = @_[0]; my ($m) = @_[1];
              return ($m + 2); }

my ($a, $b) = (10, 0);
add_one($a);
$c = add_one($a);
$d = add_two($a, $b);
print $a, "\n";
print $b, "\n";
print $c, "\n";
print $d, "\n";

```

CS571: Programming Languages

102

Subroutines (test9.pl)

```
sub add_one {my ($n) = @_ [0]; return ($n + 1); }
sub add_two { my ($n) = @_ [0]; my ($m) = @_ [1];
              return ($m + 2); }
my ($a, $b) = (10, 0);
add_one($a);
$c = add_one($a);
$d = add_two($a, $b);
print $a, "\n";
print $b, "\n";
print $c, "\n";
print $d, "\n";
```

Output: 10 0 11 2 (each # is in a different line)

CS571 Programming Languages

103

@_

```
sub add {
    @_ [0] = @_ [0] + 1;
}
my $a = 10;
add($a);
print $a, "\n";
```

CS571 Programming Languages

104

@_ (ref.pl)

```
sub add {
    @_ [0] = @_ [0] + 1;
}
my $a = 10;
add($a);
print $a, "\n";
```

Output: 11

call-by-reference

CS571 Programming Languages

105

File Operation

CS571 Programming Languages

106

Open a File

- open FH, 'output.log' or die \$!;
 - * open file output.log. If the file does not exist, die and print message held in \$!
 - * FH: file descriptor
 - * \$!: I/O error message

CS571 Programming Languages

107

Open a File for Writing (test7.pl)

- Create a new file or overwrite an existing file
open FH, "> \$filename" or die \$!;
- To add content to the end of existing file
Open FH, ">> \$filename" or die \$!;

```
open FH, "> writetest.txt" or die $!;
print FH "abc";
open FH, ">> writetest.txt" or die $!;
print FH "def";
```
- To close the file: close FH

108

Read a Line (test5.pl)

- Input Operator `<>`: reads one line from a file, including new line
- **chomp**: removes newline

Example:

```
print "What type of pet do you have?";
my $pet = <STDIN>;
chomp $pet;
print "You have pet $pet";
```

CS571 Programming Languages

109

Read a Line (test6.pl)

- Reading from files
 - Loops will assign to `$_` by default
 - Be sure that the file is opened before read

```
open FILE, "readtest.txt" or die $!;
my $lineno = 1;
while (<FILE>) {
    print $lineno++;
    print ": $_";
}
```

CS571 Programming Languages

110

Read a Line (test6.pl)

- Reading from files
 - Loops will assign to `$_` by default
 - Be sure that the file is opened before read

```
open FILE, "readtest.txt" or die $!;
my $lineno = 1;
while (<FILE>) {
    print $lineno++;
    print ": $_";
}
```

Output: content of readtest.txt with line numbers

CS571 Programming Languages

111

Read A Number of Bytes (file1.pl)

- Read a number of bytes
 - `read FILEHANDLE, SCALAR, LENGTH`
 - * `SCALAR`: stores the characters read
 - * `LENGTH`: the number of characters read

```
open FILE, "readtest.txt" or die $!;
my ($data, $n);
while (($n = read FILE, $data, 4) != 0)
{ print "$n bytes read\n";
  print $data, "\n"; }
close(FILE);
```

CS571 Programming Languages

112

Read One Character (file2.pl)

- Read a character
 - `getc FILEHANDLE`

```
open FILE, "readtest.txt" or die $!;
while(my $char = getc FILE)
{ print $char; }
close(FILE);
```

CS571 Programming Languages

113

File Checks (test8.pl)

- File test operators check if a file exists, is readable or writable, etc.
 - * `-e`: if the file exists
 - * `-r`: if the file is readable
 - * `-w`: if the file is writable
 - * `-x`: if the file is executable
 - *
- E.g.

```
my $filename = "test.txt";
if (-r $filename) { print "the file is readable\n" }
```

CS571 Programming Languages

114

Renaming/Deleting a File (file3.pl)

- Renaming a file
`rename(file1, file2);`
- Deleting a file
`unlink(file);`
success: returns the number of files deleted
failure: returns false and sets `$! Errno`

```
my $file = "hello.txt";  
unlink $file;  
if (-e $file) { print "File still exists!"; }  
else { print "File gone."; }
```
